1.

Class	speak	name
Animal	Animal.speak	Animal.name
Dog	Dog.speak (overridden)	Animal.name (inherited)
Puppy	Dog.speak (inherited)	Puppy.name (overridden)

Dog overrides speak() but inherits name() from Animal. Puppy inherits speak() from Dog but overrides name().

2. Animal a = Puppy();
   a.speak();
   The program would call Animal.speak() with static dispatch because a is declared as an Animal. This would return "...".
   The program would call Dog.speak() with dynamic dispatch because it uses the actual object's VTable. This would return "Woof".
   Static dispatch would be wrong because it uses the variable's declared type instead of the object's runtime class.

3.

Object	VTable	Method	Output
Animal()	Animal	Animal.name()	"Animal"
Dog()	Dog	Animal.name()	"Animal"
Puppy()	Puppy	Puppy.name()	"Puppy"

The first object uses Animal's VTable and calls Animal.name(), which returns "Animal". The second object uses Dog's VTable, which inherits Animal.name() and returns "Animal". The third object uses Puppy's VTable and calls Puppy.name() since it overrides the method, returning "Puppy".
